Real-World Parallels

In one of my last projects, a full-stack app with a REST API and a cloud database, I worked mainly on the React client with routed pages, dashboards, and an admin UI connected to backend endpoints. The backend stack is different here, but the frontend approach is the same.

My approach to the task

1. I defined the API contract and implemented the backend structure with DTOs and business rules for profile and address management
2. Built the frontend with a user list and detail pages, made sure that the routing was clean
3. Connected the UI to the API and synchronized state by refetching user data after address updates
4. Added loading and error handling
5. Polished the whole thing with backend tests and manual checks

Design Choices for the “User -> Address” flow

1. The app has two screens. Users open a detail page via row click or click on Manage, and return via breadcrumbs
2. The list uses a lightweight DTO
3. Profile changes stay in local form state until Save Profile button sends a request
4. UI refetches the user so the client stays aligned with the server
5. Only one address can be primary per user

How to Run

Backend

```
cd backend  
mvn spring-boot:run
```

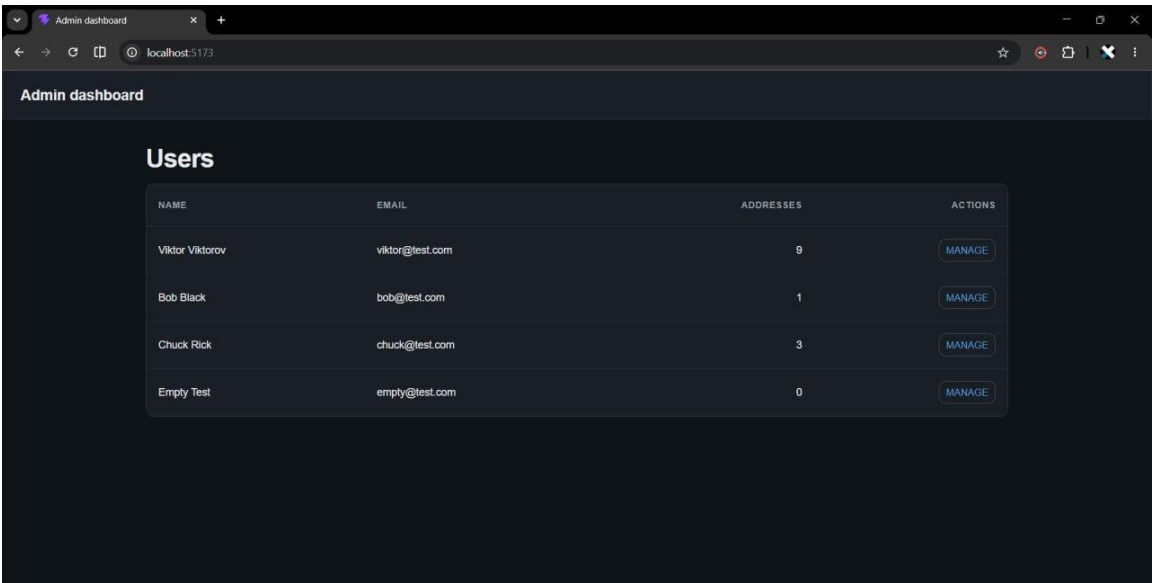

Link: <http://localhost:8080/api/users>

Frontend

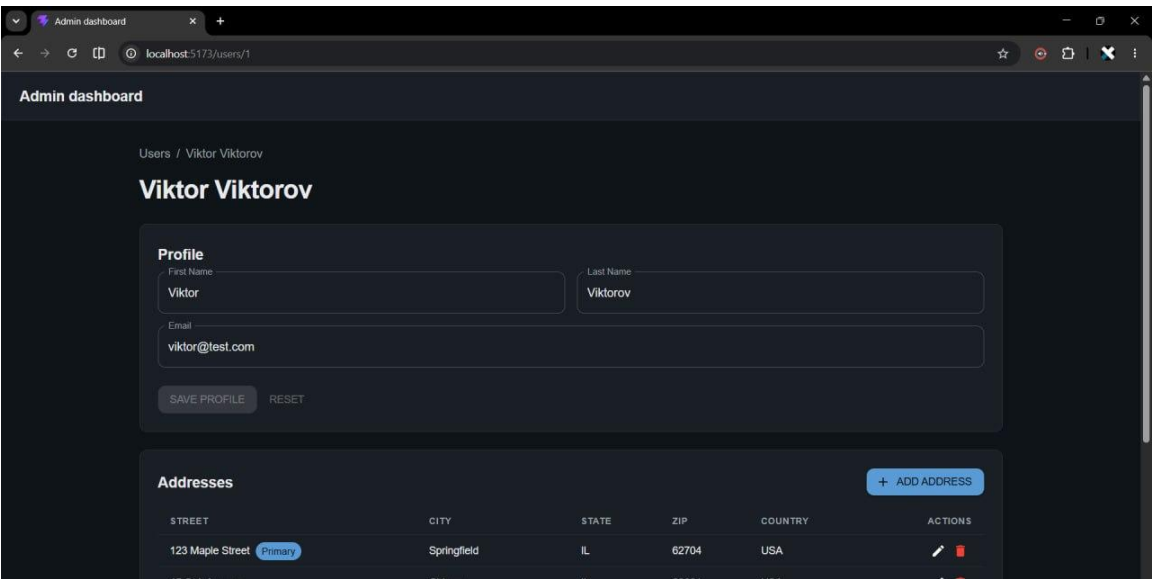

```
cd frontend
npm install
npm run dev
```

Link: <http://localhost:5173>
